

Coding Challenges

Write a function that determines if the first parameter is Palindrome or not.

```
/**
 * Generates a list of divisors of teh given number.
 *
 * @param {number} num - The number to check.
 * @returns {array} A list of integer divisors.
 */
function getDivisors(num) {
    // ...
}
```

1. **Create a function with one parameter. Have the function `console.log()` the input.**
2. **Define an empty string variable called `reverse` to store the reversed string.**
3. **Use a `for` loop to iterate through each character.**
4. **Append each character to the beginning of the `reverse` variable.**
5. **Return `true` if the contents of the input is the same as the `reverse` variable.**
